

# INFLUENZA: THE STORY

By:

An absolute beautation

Hi I'm Craig

And I'm john  
but my friends call  
me tony teapot since  
you're my friend you'll  
be calling me that  
two

And I'm joey as you  
can tell I'm pretty  
sick

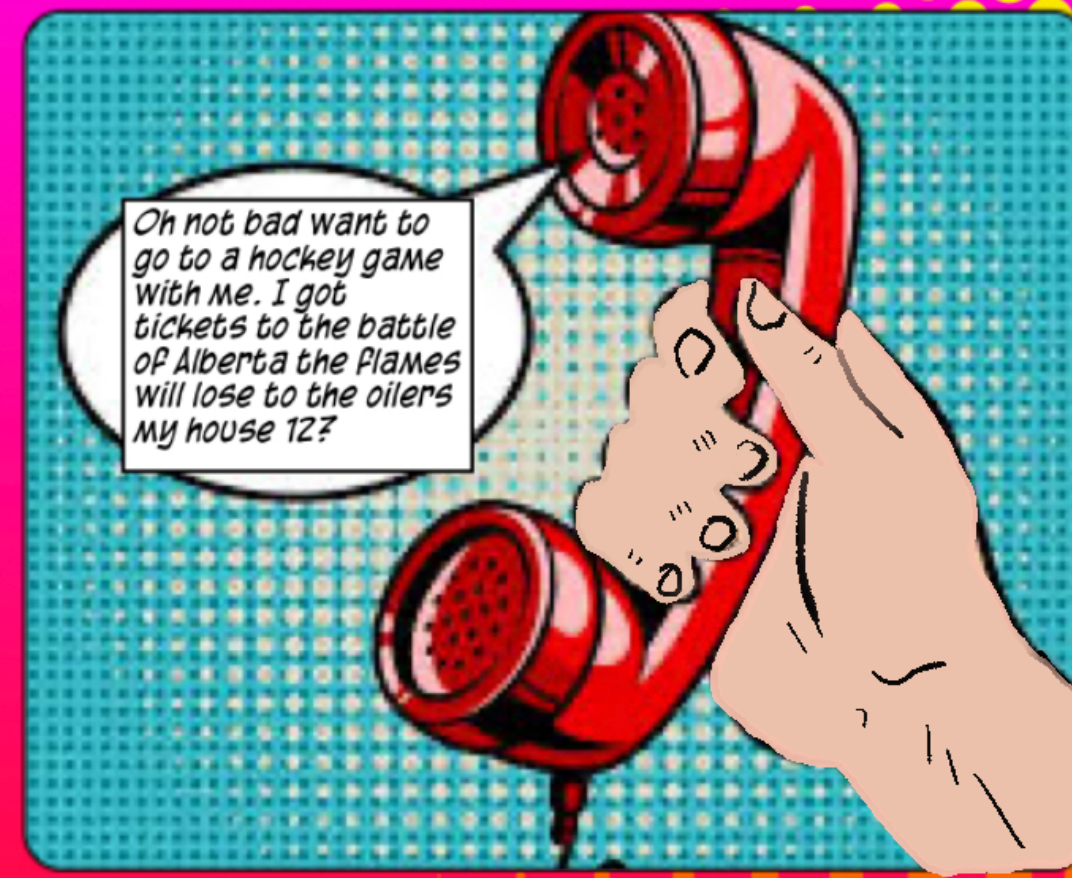

And  
finally im  
influenza other wise  
known as the flu I will  
be the bad guy in  
this story

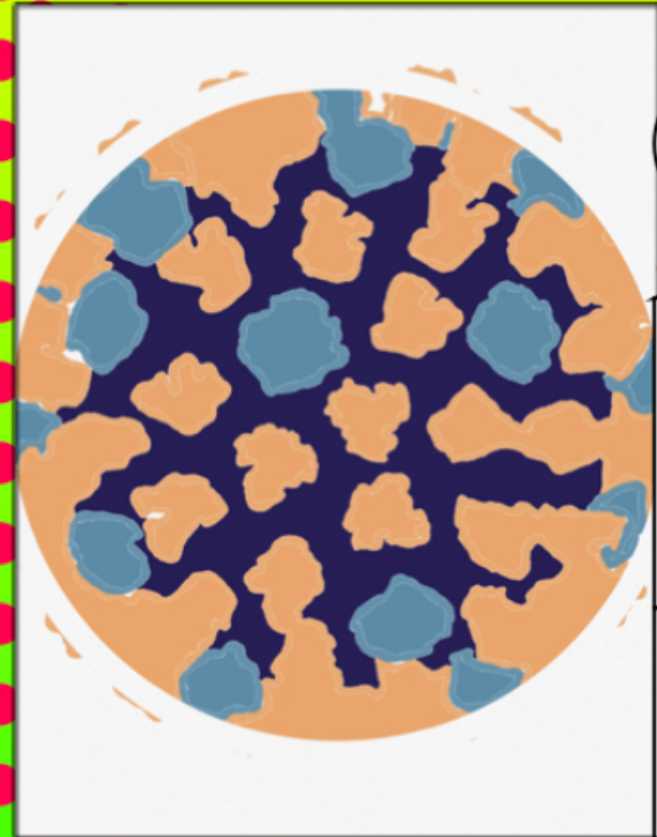

I'm a virus that was  
found in 1934

Hone  
y get me the  
phone I'm busy eating  
and watching the new  
episode of criminal  
minds

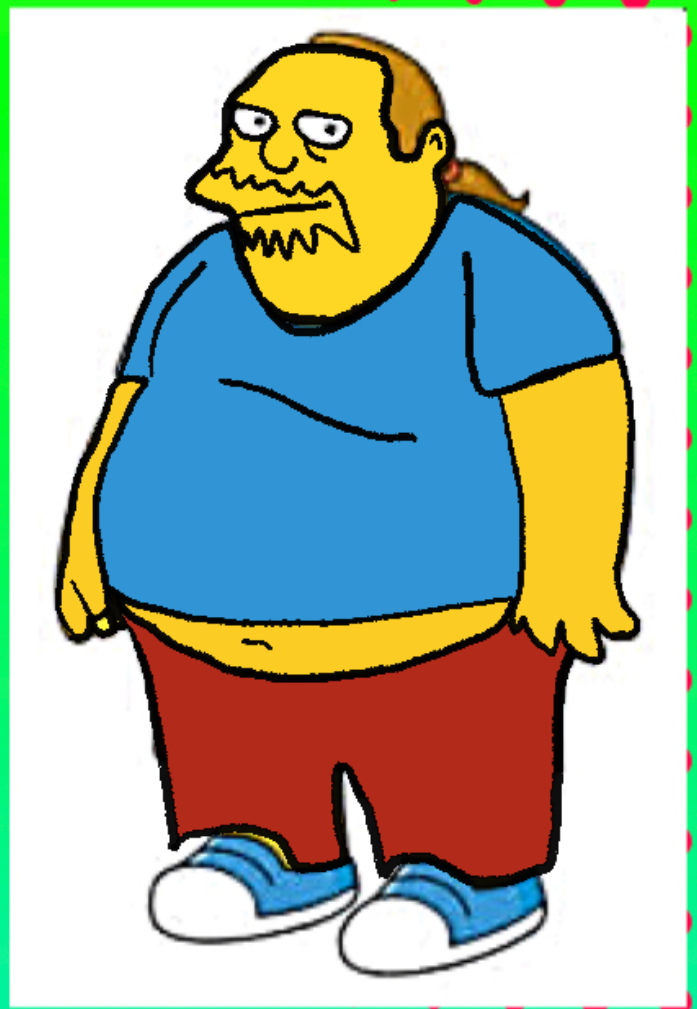

I've been waiting for more people to infect like Tony Teapot and Craig some new fresh victims

When influenza attacks a victim it will trigger a bodily response that will cause a rise in systemic glucocorticoid levels leading to systemic glucocorticoid levels

To latch on to my victims I set up residence in your nose and multiply myself to expand until all of your cells are

Uhhh were standing next to someone with a cold

Let's go the oilers scored to the game and go into overtime

Let's go

It's good that im influenza type C not B or D or else I couldn't latch on to humans only different types of animals

oilers flames  
series  
3 3-1 3

oilers flames  
series 4-1  
4 - 3  
oilers win  
flames suck

After the game

Uhh im feeling really sick I think I have the flu

I think im going to visit my doctor tomorrow but for now im just going to get some rest

Heh heh heh My plan worked

To infect cells without getting stuck in the mucus I rely on my proteins and its viral particles or else ill just dye of

Hey John how you doing

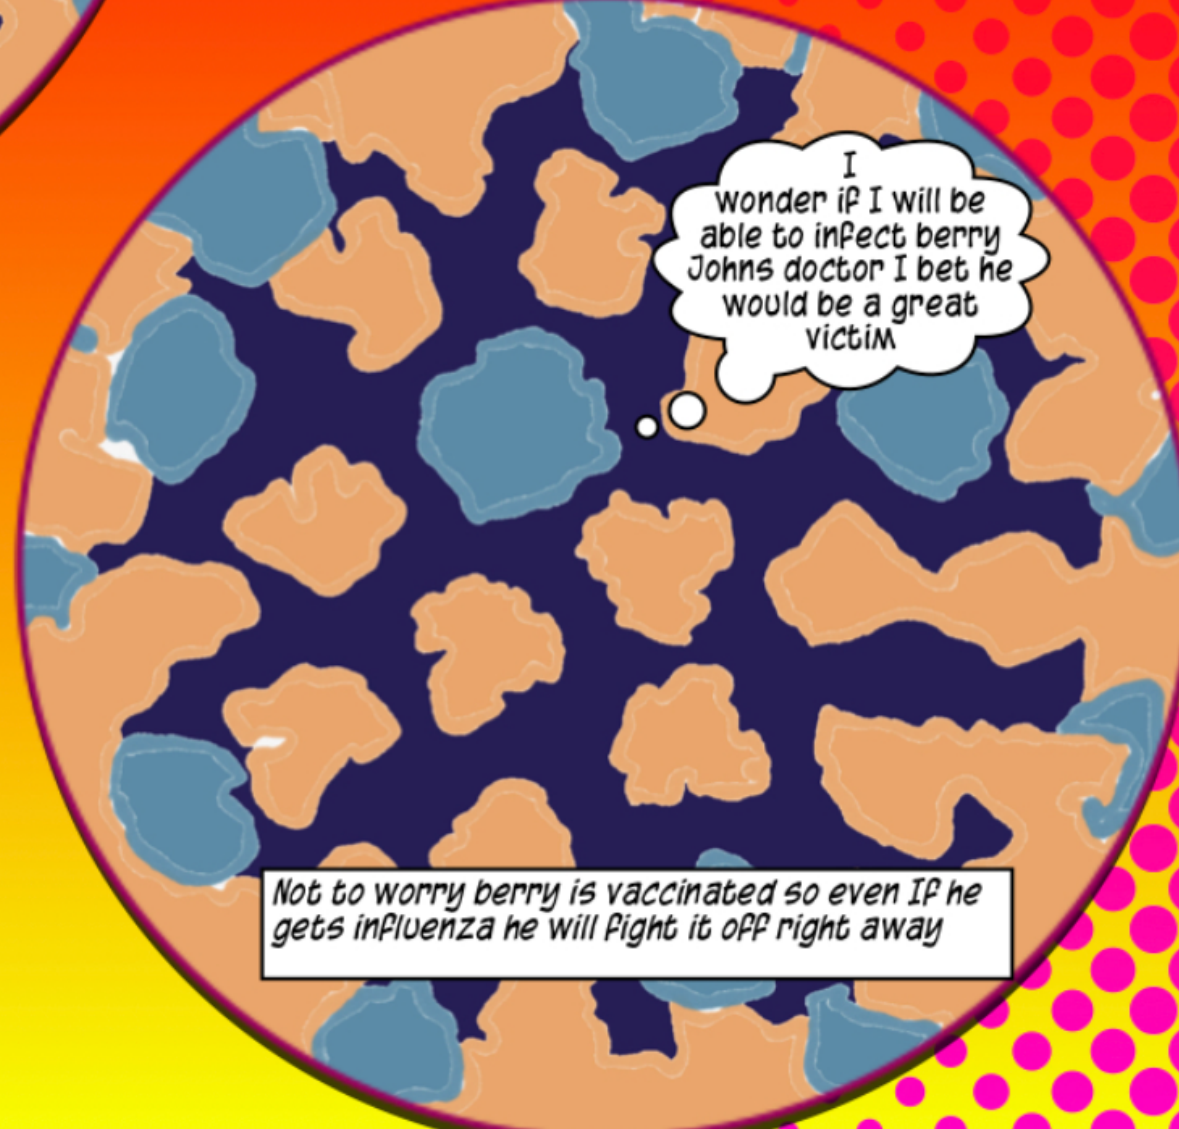

Johns doctor berry

I wonder if I will be able to infect berry Johns doctor I bet he would be a great victim

Not to great im going to stop in today because im really sick with the flu

John on the phone

Not to worry berry is vaccinated so even if he gets influenza he will fight it off right away

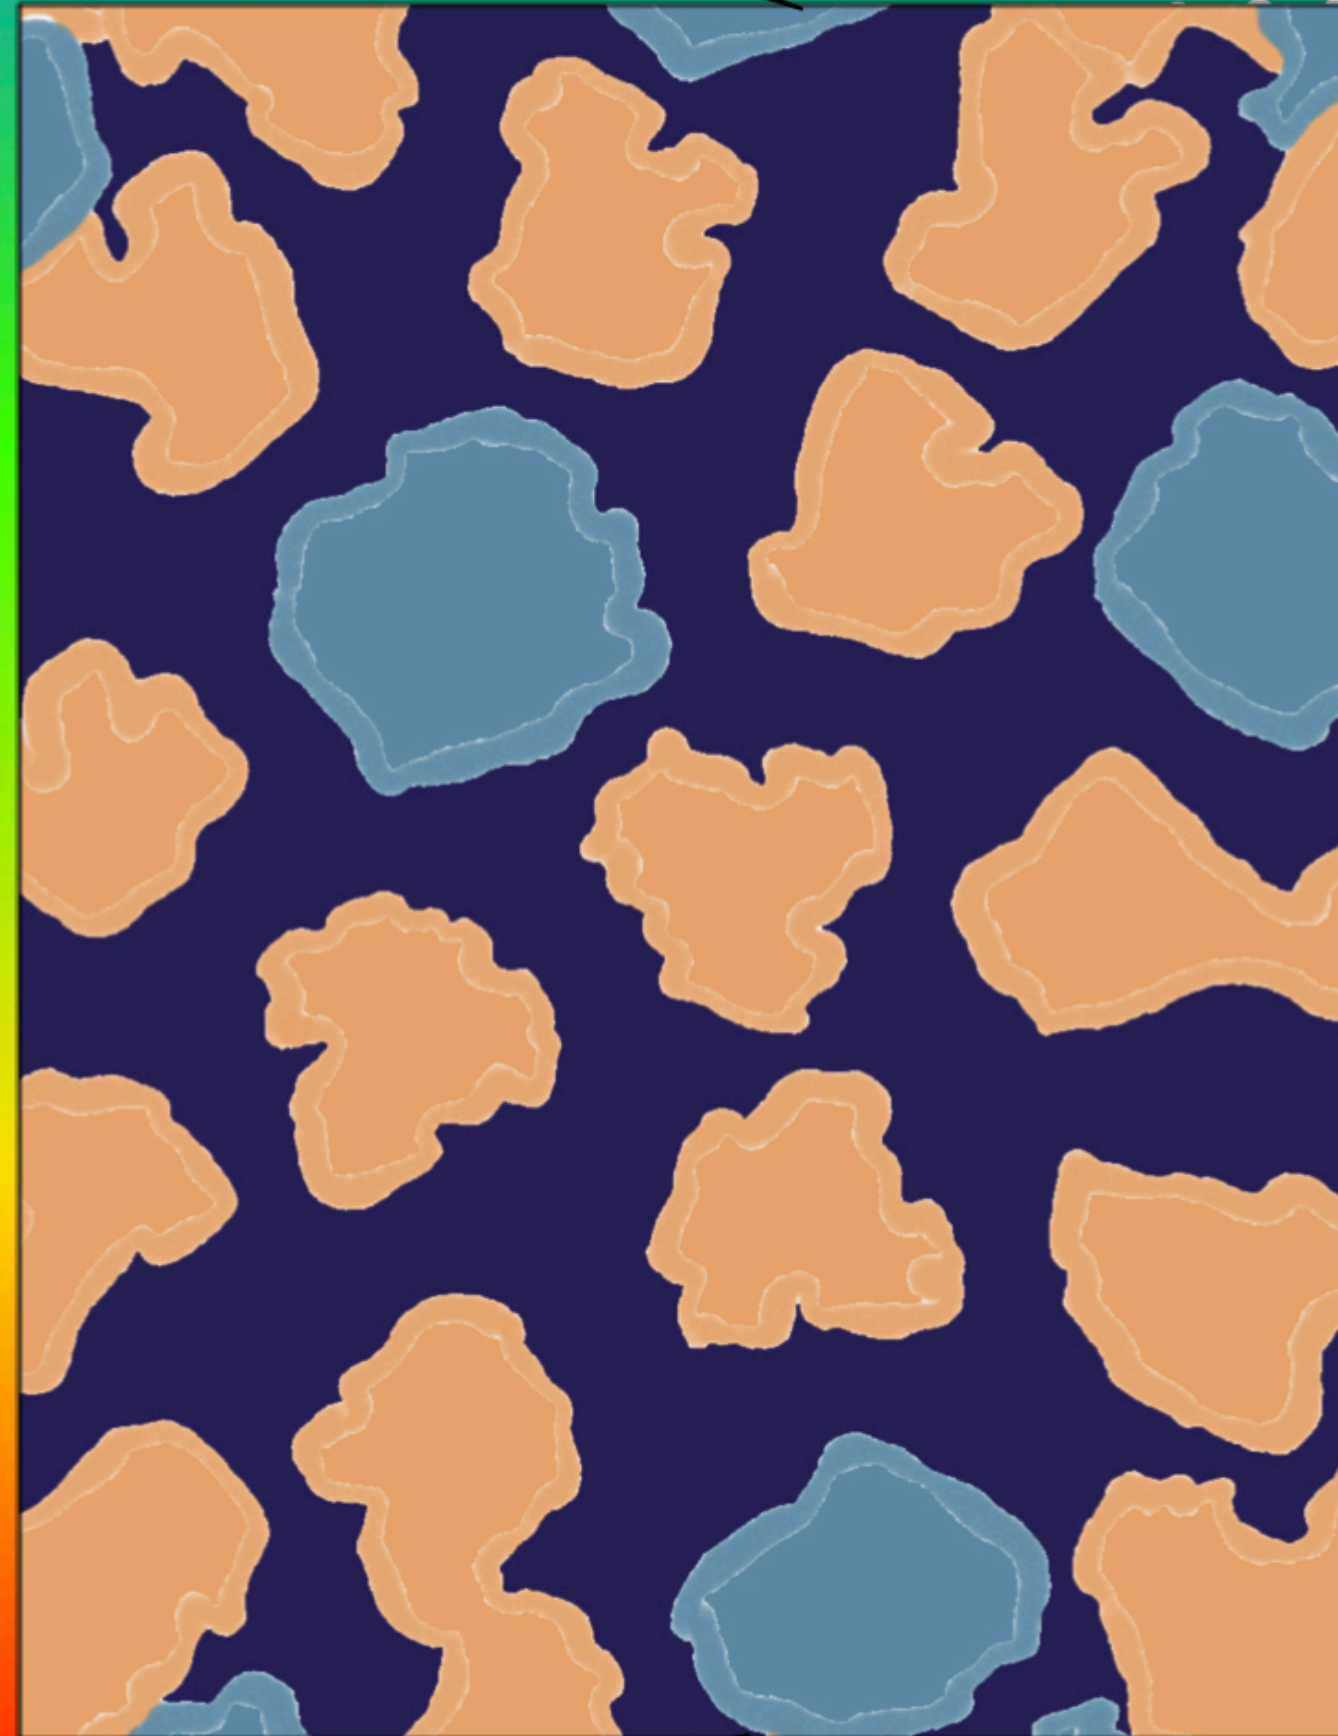

I know I have influenza because I have:  
A Fever of 100 degrees  
Sore throat and cough  
A severe fatigue  
Headache  
Runny nose and congestion  
Nausea, vomiting and diarrhea  
And chill and shivering

The way I take over I have to use steps and here they are.

1. Enter the host cell
2. enter the nucleus and VRNPs
3. Next I have to export the VRNPs from the nucleus
4. And finally I have to assemble the budding plasma membrane of the host cell.

To replicate myself within the nucleus of the host cell I have to use an uncommon RNA virus that provides influenza with the advantage of access to the nuclear machinery during replication.

*John died because he couldn't get to the doctor in time influenza is a serious thing and if you dont get vaccinated then this can happen to you as well*

*I did my job but to bad I dye due to my victim dying and cells dying*
